

I am truly concerned with BPL being even considered, since it was banned in several other countries due to the strong interference it caused. Our population in this country is so dependent on information and technology which does include HF frequencies. I can't imagine what would happen with emergency communications should this BPL service be forced on us by a few companies wanting to make an extra dollar. HF frequencies are still desired by people who want a clear channel. BPL poses a major threat to the freedoms that thousands of people use everyday. Is the FCC ready to deal with the volume of complaints that thousands of people will be filing everyday?
